

LIGHT BLASTER™ ANNOUNCES REVOLUTIONARY STROBE BASED IMAGE PROJECTOR

WHAT

The Light Blaster (or Blaster for short) is a new kind of light modifier, instead of shaping one colored light, it enables you to project an image onto a subject or a background. Kinda like creating a new world.

It is small, portable and it works with a hot shoe strobe as a light source and a standard (D)SLR lens for focusing. So if you are on a shoot, you probably have access to both. The fact that it uses a standard lens means that you can control the size of the projection - 35mm to blast an entire wall; 200mm to paint a heart on a chest.
